Non-invasive Monitoring of Liver Disease

Hin Hin Ko

Giada Sebastiani

Feb 29, 2016

This program was co-developed with CAG/Merck and was planned to achieve scientific integrity, objectivity and balance

Accreditation

This event is an accredited (Section 1) group learning activity as defined by the Maintenance of Certification program of the Royal College of Physicians and Surgeons of Canada (RCPSC). The program was produced under the RCPSC guidelines for the development of co-developed educational activities between the Canadian Association of Gastroenterology (CAG) and Merck Canada Inc.

Name: Dr. Hin Hin Ko, Dr. Giada Sebastiani

Financial Interest Disclosure

(over the past 24 months)

Dr. Sebastiani: speaker for Merck, Abbvie, Gilead, ViiV; advisory board member for Merck, BMS; she received unrestricted research funding from Merck, ViiV

Canadian Digestive Diseases Week 2016

Learning Objectives

At the end of this session, participants will be able to:

- Recognize the clinical importance of staging fibrosis for management and prognosis in chronic liver diseases
- Identify and describe the different non-invasive modalities to diagnose and monitor liver disease
- Compare and contrast the benefits and limitations of the non-invasive monitoring modalities, such as Fibroscan, Fibrotest, Fib-4 and APRI

Canadian Digestive Diseases Week 2016

Non-invasive monitoring of liver disease

CanMEDS Roles Covered:

✔	**Medical Expert** (as *Medical Experts*, physicians integrate all of the CanMEDS Roles, applying medical knowledge, clinical skills, and professional values in their provision of high-quality and safe patient-centered care. *Medical Expert* is the central physician Role in the CanMEDS Framework and defines the physician's clinical scope of practice.)
	Communicator (as Communicators, physicians form relationships with patients and their families that facilitate the gathering and sharing of essential information for effective health care.)
✔	**Collaborator** (as *Collaborators*, physicians work effectively with other health care professionals to provide safe, high-quality, patient-centred care.)
✔	**Leader** (as *Leaders*, physicians engage with others to contribute to a vision of a high-quality health care system and take responsibility for the delivery of excellent patient care through their activities as clinicians, administrators, scholars, or teachers.)
✔	**Health Advocate** (as *Health Advocates*, physicians contribute their expertise and influence as they work with communities or patient populations to improve health. They work with those they serve to determine and understand needs, speak on behalf of others when required, and support the mobilization of resources to effect change.)
✔	**Scholar** (as *Scholars*, physicians demonstrate a lifelong commitment to excellence in practice through continuous learning and by teaching others, evaluating evidence, and contributing to scholarship.)
✔	**Professional** (as *Professionals,* physicians are committed to the health and well-being of individual patients and society through ethical practice, high personal standards of behaviour, accountability to the profession and society, physician-led regulation, and maintenance of personal health.)

EASL-ALEH Clinical Practice Guidelines:

Non-invasive tests for evaluation of liver disease severity and prognosis

Journal of Hepatology

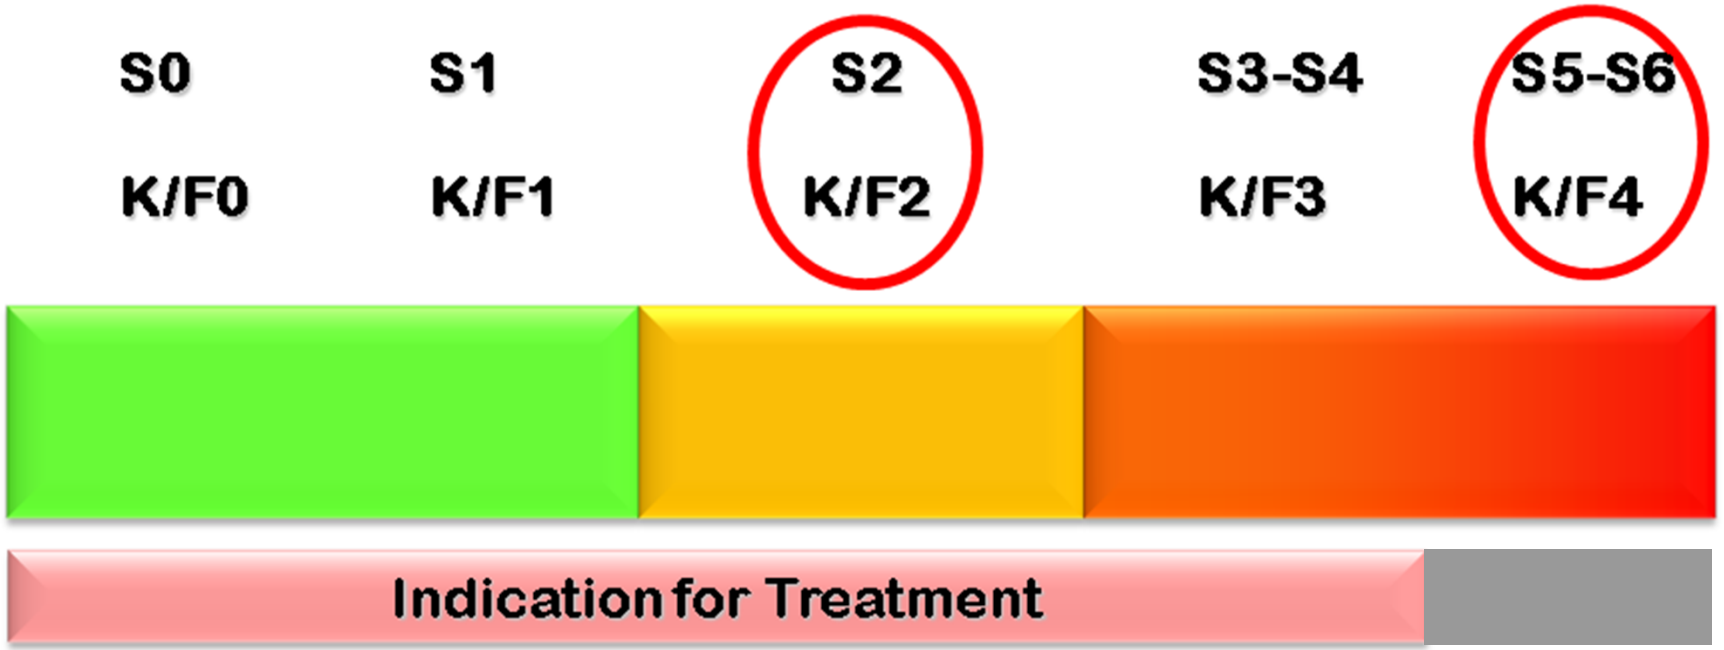
WHY IS IT IMPORTANT TO STAGE LIVER FIBROSIS?

Canadian Digestive Diseases Week 2016

PINZANI M- 2010

End-Points in Fibrogenic CLDs



F: METAVIR
S: ISHAK's
K: KLEINER

Screening for Oesophageal Varices

Screening for HCC

WHY FIBROSIS STAGE is PIVOTAL in CHRONIC LIVER DISEASES?

- **Management**
  - definitive indication to antiviral therapy in HCV and HBV and to interventions on metabolic risk factors/vitamin E therapy in NAFLD/NASH when ≥F2 by METAVIR/Kleiner
  - Screening for HCC and esophageal varices when F4

- **Prognosis**
  - The more the liver disease is advanced, the less time it takes to develop cirrhosis and end-stage complications

STAGING of FIBROSIS: HOW ?

- Liver biopsy (gold standard)
  - Advantages: direct information on fibrosis, inflammation, steatosis, comorbidities
  - Limits: semiquantitative, invasive, costly, prone to sampling errors
- Blood tests (biomarkers)
- Fibroscan (transient elastography)

Canadian Digestive Diseases Week 2016

LIVER BIOPSY IS AN INVASIVE PROCEDURE!

- ✓PAIN
- ✓BLEEDING
- ✓COST
- ✓HOSPITALIZATION

Canadian Digestive Diseases Week 2016

Complications

- HALT-C reported complications of liver biopsy in HCV patients with advanced liver disease
  - 1.1 % serious adverse events
  - 0.6% due to bleeding (most common)
    - More common if platelet <60,000
    - INR>1.3

- The mean cost in Canada for a complicates liver biopsy requiring hospitalization is $4,579

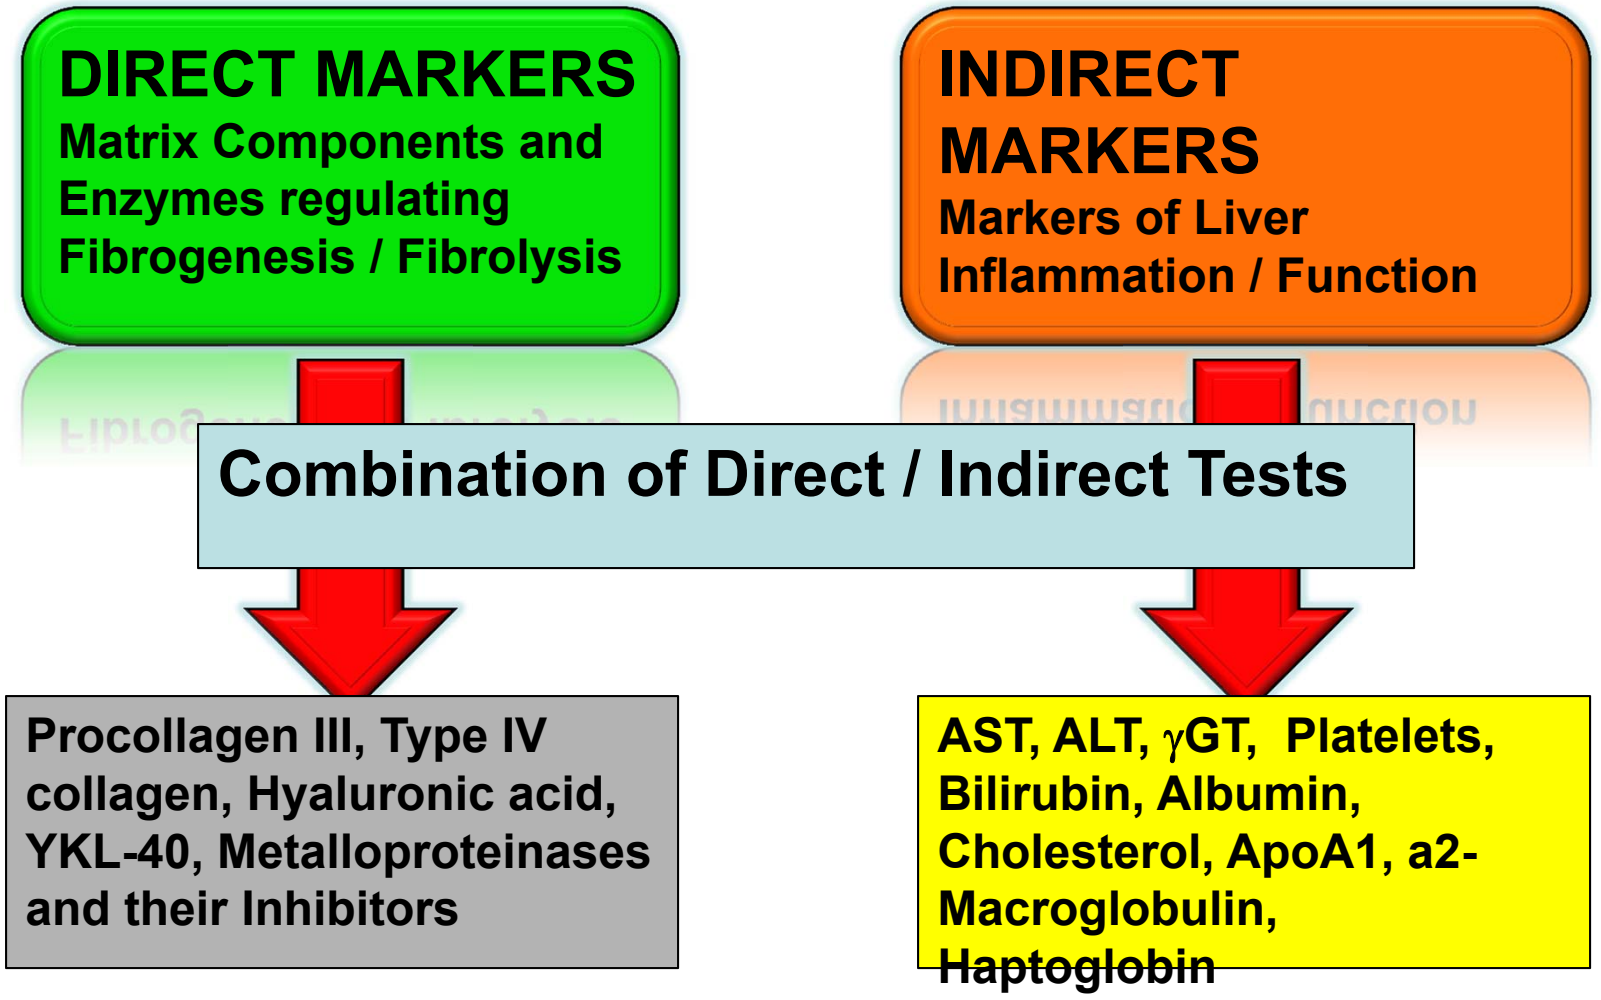
NON-INVASIVE METHODS

Canadian Digestive Diseases Week 2016

SERUM NON-INVASIVE MARKERS for LIVER FIBROSIS



Indirect Biomarkers

	Cut-off	AUROC	Classified
APRI	0.5 / 1.5	0.69-0.88	51%
Forns' index	4.2 / 6.9	0.60-0.86	49%
Fib-4	1.45 / 3.25	0.82-0.89	72.8%
AST-to-ALT ratio	1	0.51-0.83	100%

APRI = AST, platelets

Forns' index = GGT, cholesterol, platelets, age

Fib-4 = platelets, AST, ALT, age

Canadian Digestive Diseases Week 2016

APRI: THE PROTOTYPE OF THE SIMPLE BIOMARKERS FOR LIVER FIBROSIS

APRI=[AST (/ULN) x 100] / Platelet (10^9/L)

Canadian Digestive Diseases Week 2016

Wai et al, Hepatology 2003

Performance of the Aspartate Aminotransferase-to-Platelet Ratio Index for the Staging of Hepatitis C-Related Fibrosis: An Updated Meta-Analysis

Zhong-Hua Lin,[1,2]* Yong-Ning Xin,[2,3]* Quan-Jiang Dong,[2] Qing Wang,[2] Xiang-Jun Jiang,[2] Shu-Hui Zhan,[2] Ying Sun,[2] and Shi-Ying Xuan[2,3]

- 40 studies included, n=8,739
- APRI can be used in clinical practice as a good tool for the confirmation of severe fibrosis/cirrhosis when other clinical signs and examinations are nondecisive
- It is cheap and simple → reference test to be compared with the others

Although APRI shows less diagnostic accuracy than some other noninvasive methods, it is still the first choice for HCV patients to identify fibrosis in regions with limited healthcare resources

HEPATOLOGY, Vol. 53, No. 3, 2011

Direct Biomarkers and Combination Panels

	Parameters	AUC for ≥F2	AUC for F4	Validation
Fibrotest®	γGT, bilirubin, haptoglobin, ApoA1, α2M	0.74-0.87	0.71-0.87	
Fibrospect®	Hyaluronan, TIMP1, α2M	0.82-0.87	-	
ELF®	Hyaluronan, PIIINP, TIMP1	0.80	0.95	
Fibrometer®	Platelets, PT, AST, α2M, hyaluronan, BUN	0.85-0.89	0.91

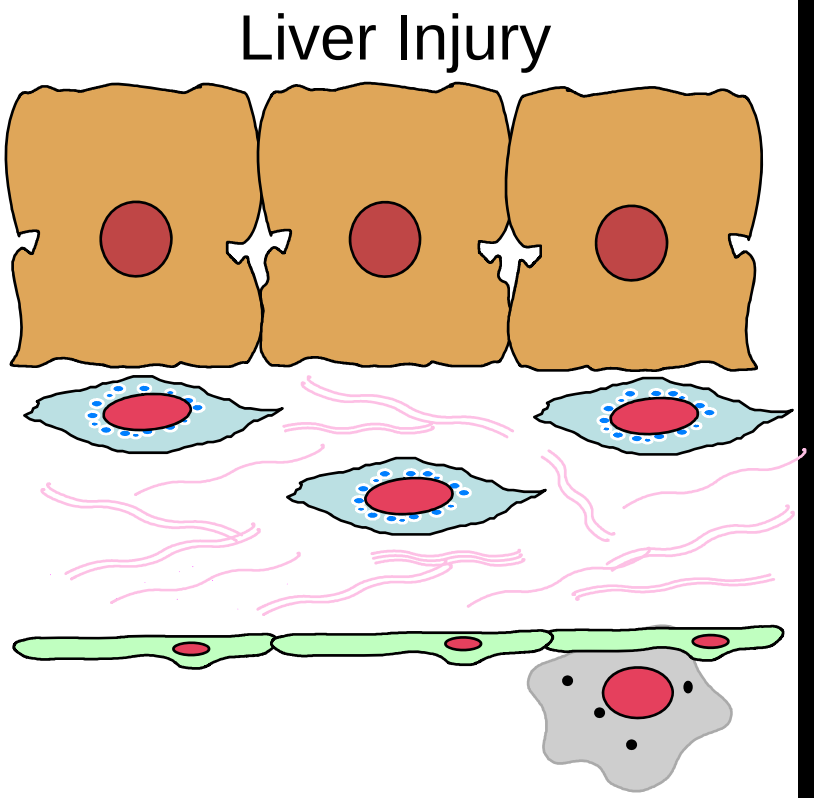
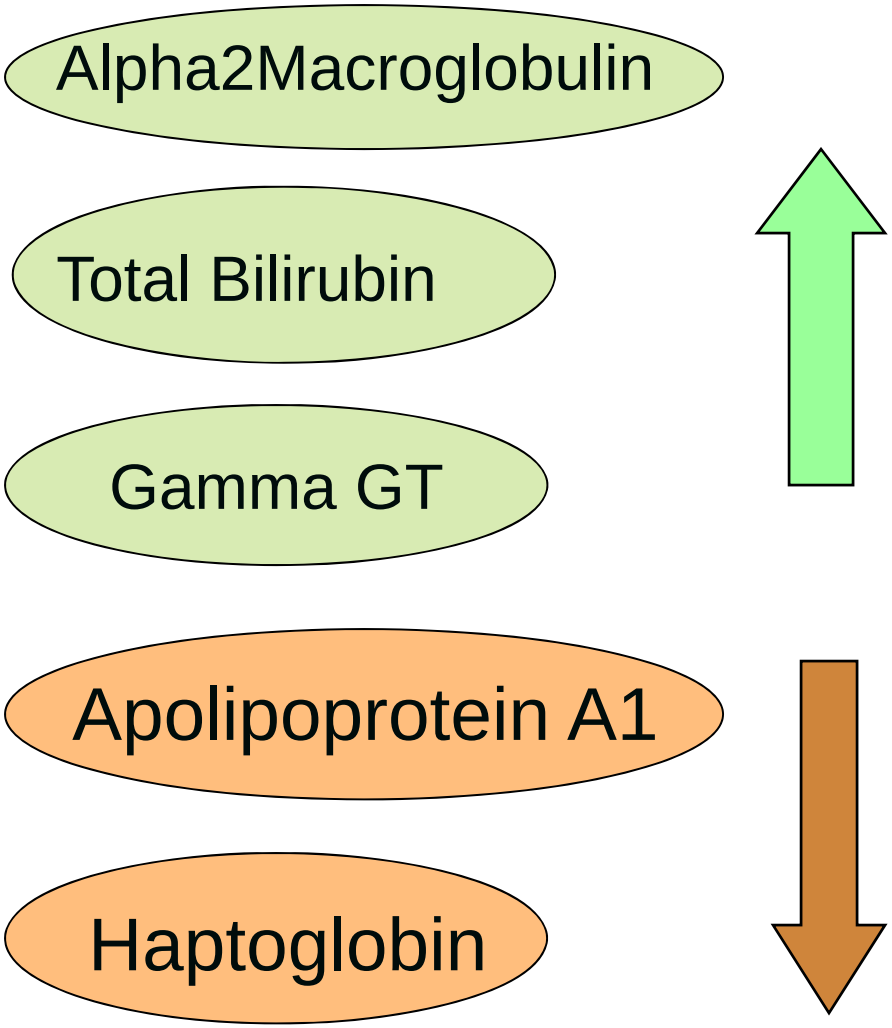
In Situ

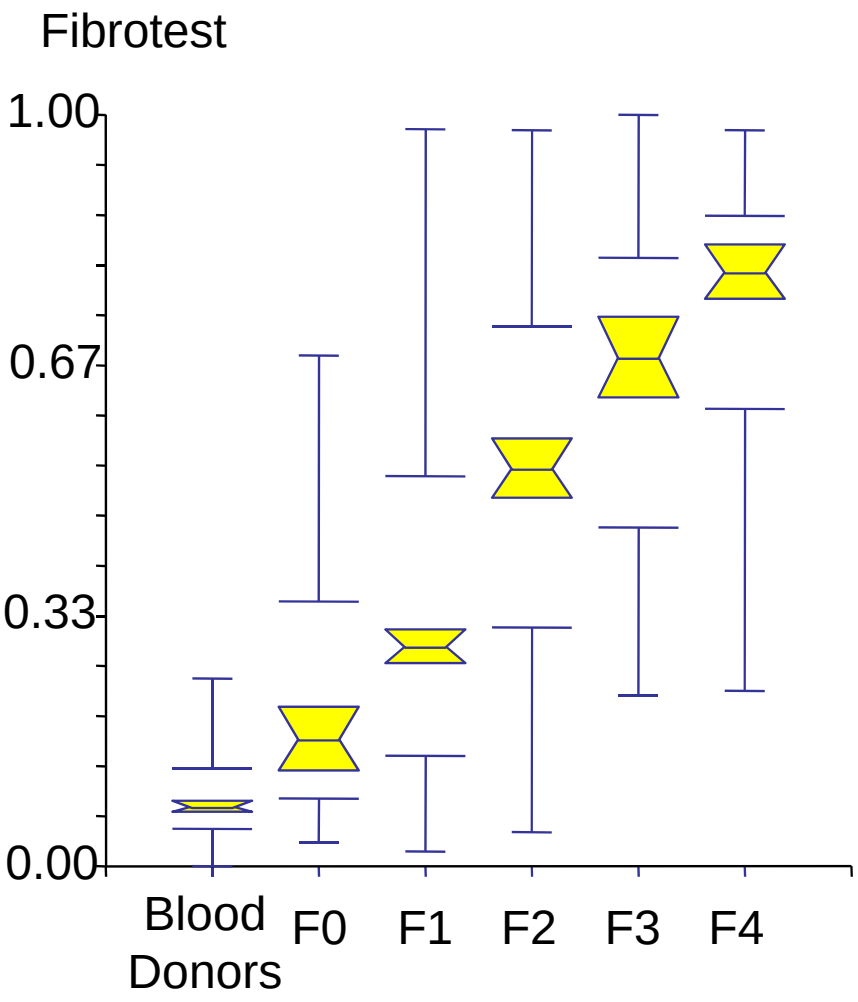


In Serum: FibroTest



Imbert-Bismut et al, Lancet 2001

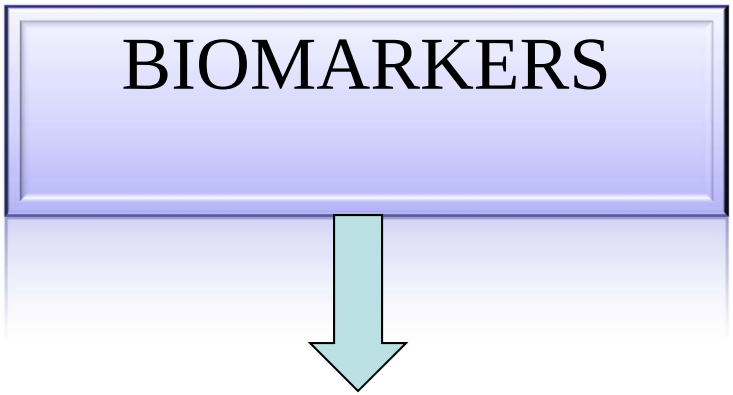
FIBROTEST IN HEPATITIS C



FibroTest	Estimate of fibrosis stage
0.75-1.00	**F4**
0.73-0.74	**F3-F4**
0.59-0.72	**F3**
0.49-0.58	**F2**
0.32-0.48	**F1-F2**
0.28-0.31	**F1**
0.22-0.27	**F0-F1**
0.00-0.21	**F0**

Imbert-Bismut et al, Lancet 2001

SERUM BIOMARKERS : PITFALLS



Risk factors for biomarkers

- hemolysis (Fibrotest)
- Gilbert (Fibrotest)
- systemic inflammation (Fibrotest)
- extra-hepatic cholestasis (Fibrotest)
- thrombocytopenia not liver-related (APRI)

Liver stiffness

- Assessed by US (FibroScan®) & more recently by MRI
- Evaluates velocity of propagation of a shock wave within liver tissue (examines a physical parameter of liver tissue which is related to its elasticity)
- Rationale
  - Normal liver is viscous
  - Not favorable to wave propagation
  - Fibrosis increases hardness of tissue
  - Favors more rapid propagation

Canadian Digestive Diseases Week 2016

Bedossa P. Liver Int 2009 ; 29 (s1): 19 – 22.

FibroScan

Painless

Rapid (5 min)

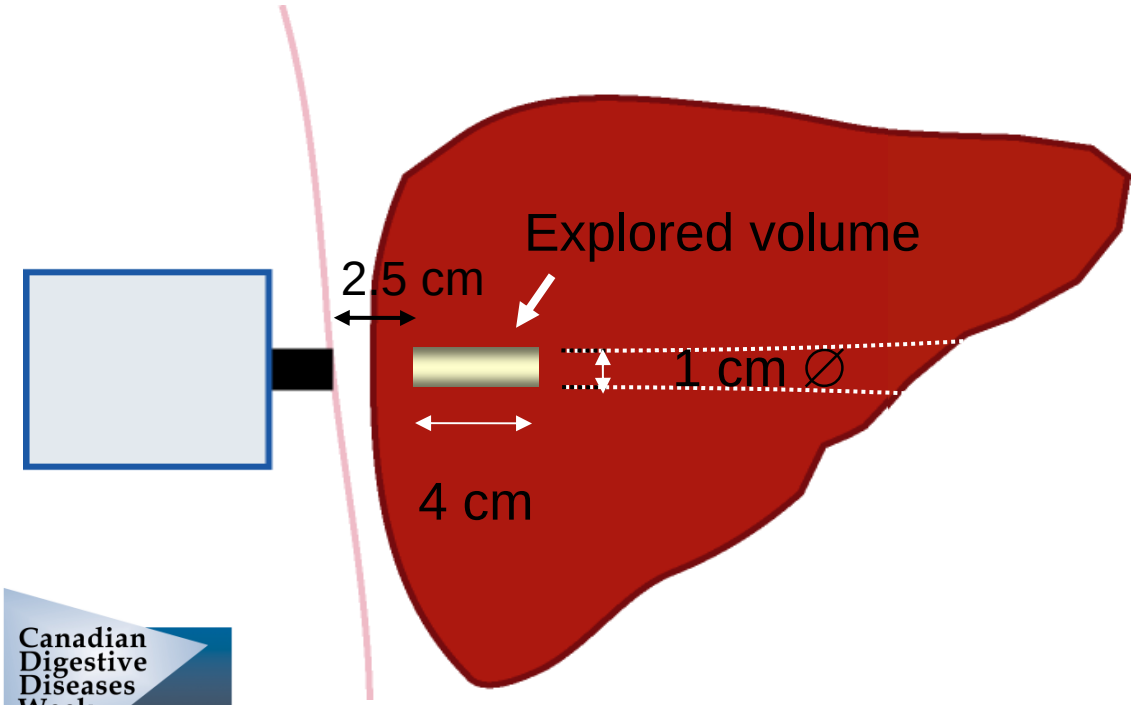
Bedside/Outpatient

Immediate results (3 - 75 kPa)

>1500 peer-reviewed studies

Position of probe & explored volume

« The stiffer the liver, the faster the shear wave propagates »



Cylinder of 1 cm wide & 4 cm long

From 25 mm to 65 mm below skin surface

This volume is at least **100 times** bigger than a biopsy sample

Canadian Digestive Diseases Week 2016

Results

Stiffness (kPa)
Median value of 10 shots

❸ IQR * (kPa)
Interval around median
Contains 50% of valid shots
≤ 30% of median value

❶At least 10 shots
❶Success rate ≥60%

Accuracy in Hepatitis C

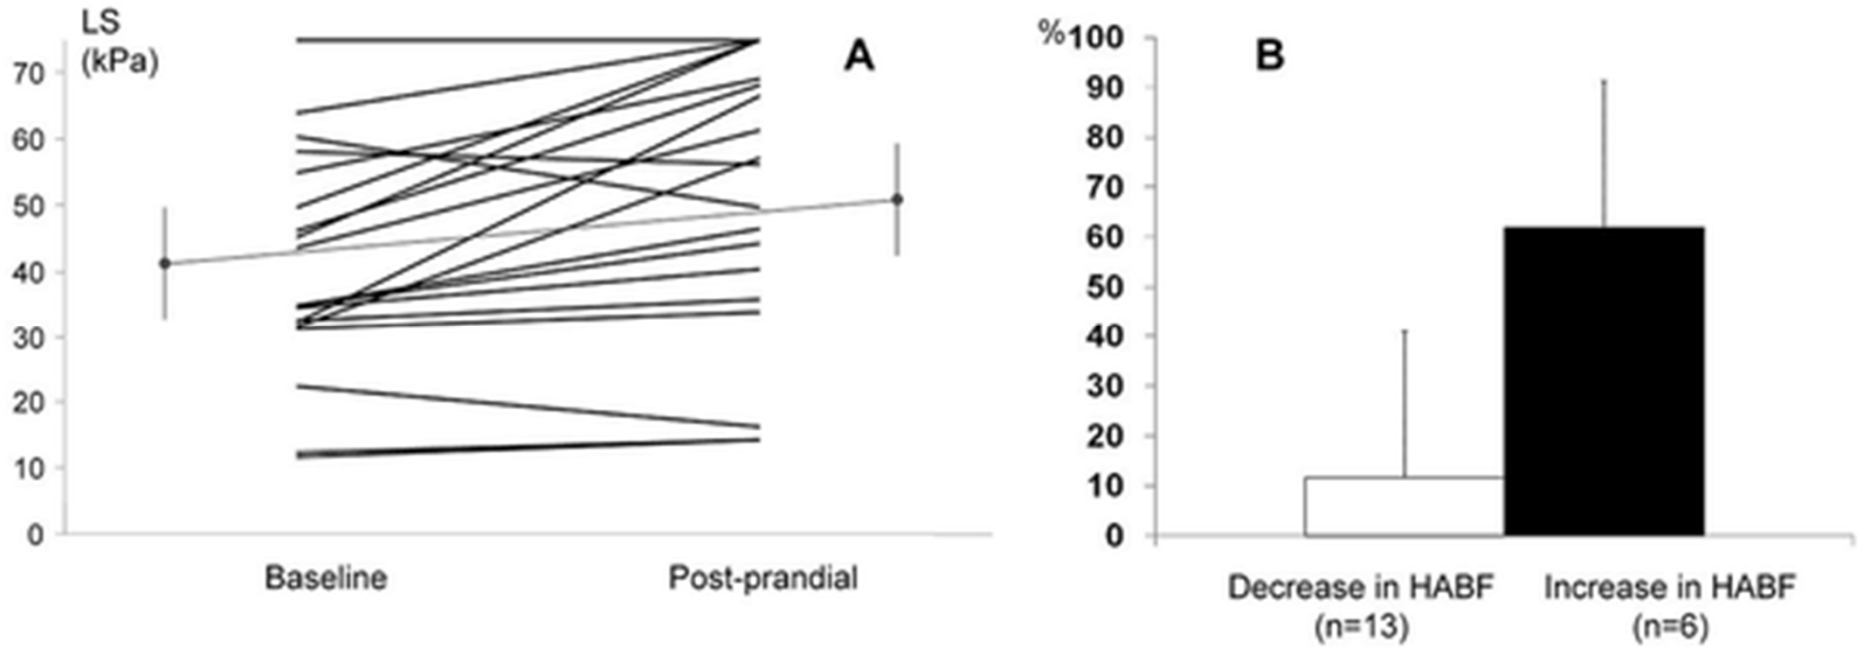
Effect of ingestion of a meal on the elasticity of the liver in patients with cirrhosis and portal hypertension



4 hours fasting required!!

Berzigotti et al, PLoSONE 2013

Serum biomarkers vs TE

	Advantages	Disadvantages
Serum Biomarkers	• Good reproducibility • High applicability (90%) • Well validated • Can be performed in the outpatient clinic	• Non-specific of liver liver • Unable to disriminate between intermediate stages of fibrosis • Cost and limit availability
Transient elastography	• User-friendly • Good reproduciblity • High performed for cirrhosis (AUROC>0.90) • Most widely used and validated technique	• requires a dedicated machine • Applicability lower than serum markes (obesity, ascites) • Falsely elevated results in setting of acute hepatitis, liver congestion, food intake

Canadian Digestive Diseases Week 2016

SUMMARY AND CLINICAL DIRECTIONS

- Liver fibrosis staging is pivotal for management of patients with chronic liver diseases
- Non-invasive tools for liver fibrosis diagnosis have high diagnostic and prognostic accuracy
- They can be used for risk stratification, prioritization for interventions such as antiviral/metabolic therapy, surveillance for HCC/varices and liver transplantation
- An optimal way to stage liver fibrosis in clinical practice is to combine two non-invasive tests and reserve liver biopsy to discordant cases or where an overlapping etiology is suspected

Thank you

Canadian Digestive Diseases Week 2016

Evaluation and Certificate of Attendance

Please visit the CAG website at http://www.cag-acg.org/ to complete the session evaluation and to receive your certificate of attendance.

Or better yet, download the CDDW™ App from the CAG website!
